

Two New NC-140 Apple Trials: Vineland and Geneva Rootstocks with Honeycrisp and Fuji at Rutgers Snyder Farm

Win Cowgill and Rebecca Magron
New Jersey Agriculture Experiment Station

Jon M. Clements and Wesley R. Autio
University of Massachusetts

Two new apple rootstock plantings were established at the Rutgers Snyder Research and Extension Farm, Pittstown, Hunterdon County, NJ. These plantings are part of the NC-140 Regional Rootstock Research Project (<http://nc140.org>).

Objective 1 is “To evaluate the influence of rootstocks on temperate-zone fruit tree characteristics grown under varying environments using sustainable management systems.” In this case, the growth and productivity of Honeycrisp and Fuji apple trees on Vineland and Geneva apple rootstocks are being evaluated. The 2014 trials are located in 18 states and Canadian Provinces.

This Vineland-Geneva planting is be-

ing coordinated by Dr. John Cline, University of Guelph, Ontario, Canada. Vineland rootstocks were bred as open-pollinated hybrids of Kerr crabapple and M.9 rootstock at the Vineland Experiment station in

Vineland, Ontario. They include V.1, V.2, V.3, V.4, V.5, V.6, and V.7. V.1 is already commercially available and is similar in vigor to M.26. V.3 is more dwarfing but is not yet commercially available. V.4 will not be commercialized, as may be the case for V.2 also. V.5, V.6, and V.7 are largely untested, although it is known V.5 and V.6 are dwarfing, while V.7 is a semi-dwarf. Vineland rootstocks are purported to be very cold-hardy and display field-resistance to fire blight. V.1 and V.3 have been tested in previous NC-140 plantings and have performed well.

Geneva rootstocks are better known and more widely available, although supply has been constrained to date. For more information on the commercially available Cornell-Geneva rootstocks, see: <http://www.cctec.cornell.edu/plants/GENEVA-Apple-Rootstocks-Comparison-Chart-120911.pdf>

The two 2014 NC-140 Vineland and Geneva apple rootstock planting with Honeycrisp and Fuji were planted April 23, 2014, at the Rutgers Snyder Farm. Both trials have V.1, V.5, V.6, V.7 and various Geneva stocks with M.9 NAKBT337 and M.26 ELMA as the controls. See the data tables for the complete list.

Trees were supplied by Willow Drive Nursery. Tree spacing is 1 x 4 m. The experimental design is a randomized complete block. Trees were trained and supported as a tall-spindle-apple. Drip irrigation was installed shortly after planting. Tree growth was excellent on the Honeycrisp trial, but the Fuji trees sat still until late July. This seemed to be the case across the other planting sites in North America. The Fuji trees

supplied were very large and had very few roots. Our consensus was the trees had to make new roots before top growth could occur. In year two, the Fuji trees are off and running.

Shortly after planting in April, measurements were made of trunk circumference at 30 cm above the graft union, number of side branches greater than 10 cm long, and tree height. In October after tree growth had ceased, measurements were made of trunk circumference at 30 cm above the graft union, height of graft union above soil, number of side branches greater than 10 cm long, and tree height.

Results

At the end of the 2014 growing season, the largest trees as measured by trunk cross-sectional area (TCA) were on G.30, V.1, V.5, and V.6 all with a TCA of 3.8 cm² (1.5 inches²). The smallest trees were on G.202 at 1.7 cm² (0.7 inches²).

There was lot of variability in the number of feathers on each tree; V.5, V.6, G.11, M.9 NAKBT337, and G.30, in order, had the most, V.5 with 12.8 feathers. G.202 had the fewest with 2.7.

At the end of the 2014 growing season, the largest trees as measured by TCA were on G.30 followed by V.6, V.7, and V.1. The smallest trees were on G.41, G.935, and G.11.

The Honeycrisp trees had more feathers overall and grew better in 2014. G.30 had the largest number of feathers with 2,1 and G.202 had the smallest with 5.

Quality Ag Equipment

Built to Last Since 1986

COMMERCIAL ORCHARD & PRODUCE EQUIPMENT

DECKOVER FIELD PACKING WAGONS

- Conveyor Compatible
- 2 Rows of Bins with Center Aisle
- 4# Steel Grate Decking
- Walking Beam Axles Standard

Model	Length	Width	Bin Capacity	Weight Capacity
12-1022DOBT	22'	120"	12	24,000#

LOW-PRO BIN TRAILERS

- Grip Strut Steps for Safety
- 4# Steel Grate Decking
- Walking Beam Axles Standard
- GAP Required Accessories

Model	Length	Width	Bin Capacity	Weight Capacity
8-524LPBT	24'	60"	7	8,000#

HAYRIDE WAGONS

- Built to Suit Customer Needs
- Industry Leading Safety Features
- Multiple Seating Configurations
- Folding & Stationary Steps
- Roof Options Available

Optional Walking Beam Axles

Optional Hitches

Optional LED Light Packages

Covered by Diller's Exclusive 3 Year Warranty
